

Empathy Map

Date	29 September 2026
Team ID	SWTID-2026-1038
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	4 Marks

Empathy Map

Create an empathy map to understand the customer/user from four perspectives - what they Say, Think, Do, and Feel - in relation to the problem your project addresses. This helps the team build a customer-centric solution.

SAYS • "I need to submit an IT support request." • "I want to know that my ticket was received." • "I need my issue to reach the right support team."	STUDENT / TEACHER (Ticket Requester)	THINKS • "Will my ticket be categorized correctly?" • "How long will it take before someone handles my issue?" • "I should not have to submit the same request again."
DOES • Enters caller details and a short issue description. • Submits a ticket with category/subcategory initially blank. • Waits for the support team to classify and handle the incident.		FEELS • Uncertain when there is no immediate acknowledgement. • Frustrated by delays or duplicate submissions. • Reassured when the system confirms the ticket immediately.

Project context: The map reflects the documented workflow in which students and teachers submit incident requests, Flow Designer classifies them from the short description, and an automated confirmation email is sent to the caller.
