

Customer Journey Map

Date	15 March 2026
Team ID	SWTID-2026-1038
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	2 Marks

Customer Journey Map

Map out the customer's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage.

Phase of Journey	Stage 1 Ticket Submission	Stage 2 Automatic Classification	Stage 3 Acknowledgement & Support
Actions What does the customer do?	- Opens the Incident Workflow form. - Enters caller name and short description. - Leaves Category and Subcategory blank.	- Flow Designer trigger runs when the record is created. - Short description is checked against keyword rules. - Category and Subcategory are updated automatically.	- System sends a confirmation email to the caller. - Ticket is available with category and subcategory. - IT agents receive a pre-sorted ticket for troubleshooting.
Touchpoint What part of the service do they interact with?	- Incident Workflow form - Caller and Short Description fields - ServiceNow ticket submission	- Flow Designer - Keyword/condition branches - Update Record action	- Automated email notification - Caller email address - Pre-sorted IT queue / support team
Customer Thought What is the customer thinking?	"I need to report my IT issue." "I hope I entered enough information." "I want my request to be recorded."	"Will the system understand my issue?" "I should not need to choose everything manually." "The ticket should reach the right category."	"My ticket has been received." "Now the support team can work on it." "I want the issue resolved quickly."
Customer Feeling What is the customer feeling?	- Need for an easy submission process - Uncertainty before confirmation - Expectation of quick registration	- Reassured by automation - Less effort than manual classification - Concern if a keyword is not recognized	- Reassured by immediate acknowledgement - Confident the request is registered - Expectant about resolution

Process Ownership Who is in the lead on this?	Ticket Submission Requester / ServiceNow form	Classification Flow Designer automation	Notification & Queue Flow Designer + IT support team
Opportunities How can we improve this stage?	• Make the form simple and clear. • Capture enough issue detail in Short Description. • Provide immediate submission confirmation.	• Expand keyword rules and synonyms. • Add more categories and subcategories. • Use Predictive Intelligence / ML in future.	• Improve notification templates. • Auto-route tickets to assignment groups. • Add SLA tracking and escalation.

Journey summary: The documented solution moves the requester from ticket submission to automatic Flow Designer classification and then to immediate email acknowledgement and a pre-sorted IT queue.
