

Solution Requirements

Date	29 September 2026
Team ID	SWTID-2026-1038
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	4 Marks

Define Functional and Non-Functional Requirements:

Create a comprehensive list of requirements to define exactly what the Auto Ticket Classification solution will do and how well it will perform. Functional Requirements describe system behavior, while Non-Functional Requirements describe quality, performance, reliability, security, and usability criteria.

Step 1: Functional Requirements (FR)

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
1	Ticket submission	Allow students and teachers to create an Incident Workflow ticket with caller details and a short issue description. Category and Subcategory can initially be blank.	High
2	Automatic classification	When a ticket is created with Category empty, Flow Designer evaluates the Short Description and automatically assigns the appropriate Category and Subcategory using predefined keyword rules.	High
3	Network classification	If the Short Description contains WiFi or Network, set Category = Network and Subcategory = Wi-Fi.	High
4	Hardware classification	If the Short Description contains Projector or Prajector, set Category = Hardware and Subcategory = Projector.	High
5	Access classification	If the Short Description contains Forgot password or Password, set Category = Access and Subcategory = Forgot Password.	High
6	Performance classification	If the Short Description contains Slow Computer or Performance, set Category = Performance and Subcategory = Slow computer.	High
7	Dependent choices	Maintain data integrity by making Subcategory dependent on Category: Wi-Fi→Network, Projector→Hardware, Forgot Password→Access, Slow Computer→Performance.	High
8	Automated notification	After classification, automatically send a confirmation email to the caller using the caller's email address and ticket reference details.	High

Solution Requirements

Step 1: Functional Requirements (FR) — Continued

S.No	Requirement Category	Requirement Description	Priority (High/Medium/Low)
9	Incident record update	Flow Designer must update the Incident Workflow record with the assigned Category and Subcategory and commit the values to the database.	High
10	Pre-sorted IT queue	Classified tickets should be available to IT support staff with the issue type already identified for immediate troubleshooting and assignment.	High
11	Auto-numbering	Incident Workflow records use an auto-generated incident reference number with the documented INC prefix and five-digit numbering format.	Medium
12	Deployment	Package the configuration and workflow into a ServiceNow Update Set and export it as XML for migration across development, testing, and production instances.	Medium
13	Auditability	Track flow execution, record updates, and outbound email activity through ServiceNow execution and email logs.	Medium

Step 2: Non-Functional Requirements (NFR)

S.No	NFR Category	Requirement Description	Target Metric / Acceptance Criteria
1	Performance & Speed	Classification should occur immediately when a qualifying incident record is created, without manual triage.	Classification target: under 1 second, as documented.
2	Scalability	The event-driven Flow Designer approach should support increased ticket volume without requiring manual classification of each ticket.	Supports peak-period ticket surges through automated triage.
3	Security & Data Privacy	Use ServiceNow access controls and reference fields for caller information; email is sent to the caller associated with the ticket.	Only authorized users should access incident and configuration data.
4	Reliability & Availability	Workflow triggers, record updates, and notifications should execute consistently whenever qualifying tickets are created.	Successful execution and notification verified through ServiceNow logs and test cases.
5	Usability & Accessibility	Provide simple ticket entry with caller, Short Description, Category, and dependent Subcategory fields.	Users can submit tickets without manually choosing a conflicting Subcategory.
6	Maintainability & Portability	Administrators can modify keyword rules and extend branches visually; configurations are packaged through Update Sets.	Configuration deployable across Dev/Test/Production using Update Set XML.

Solution Requirements — Project Workflow Summary

Project Detail	Documented Project Configuration
Team ID	SWTID-2026-1038
Project Title	Auto Ticket Classification Using Flow Designer
Platform	ServiceNow Now Platform
Automation	Flow Designer — Record Created trigger and conditional classification branches
Custom Table	Incident WorkFlow (u_incident_workflow)
Classification Categories	Network / Wi-Fi; Hardware / Projector; Access / Forgot Password; Performance / Slow Computer
Notification	Automated confirmation email to the caller after classification
Deployment	Project Update Set exported as XML

End-to-End Flow

1. Ticket Submission	Student/teacher enters Caller and Short Description.
2. Trigger	Flow Designer starts when a new Incident Workflow record is created with Category empty.
3. Classification	Keyword conditions identify the appropriate Category and Subcategory.
4. Record Update	Flow Designer updates the incident record with the classification.
5. Notification	A confirmation email is sent to the caller with ticket details.
6. Support Queue	The IT team receives an already classified ticket for troubleshooting and assignment.

Prepared from the submitted project documentation for Auto Ticket Classification Using Flow Designer. The Team ID and project title are taken directly from the project document.
