Project Title	Auto Ticket Classification Using Flow Designer
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) Report

The proposal aims to automate the initial classification and acknowledgement of IT helpdesk tickets using ServiceNow Flow Designer. When a ticket is created, the workflow checks its short description, assigns a matching category and subcategory, updates the record, and sends a confirmation email to the caller. This reduces repetitive manual triage, supports consistent categorization, and improves the speed of the first response.

Project Overview	
Objective	Automatically classify incoming incidents using keyword-based rules and provide immediate email acknowledgement.
Scope	Create an Incident Workflow table, configure category and dependent subcategory choices, build Flow Designer branches, update ticket records, and send email notifications.
Problem Statement	
Description	Manual ticket review and categorization consume support staff time and can lead to inconsistent labels, delayed acknowledgements, and incorrect category/subcategory combinations.
Impact	These issues can slow initial triage, reduce data consistency, increase duplicate requests, and make it harder to analyze recurring IT problems.
Proposed Solution	
Approach	Use an event-driven ServiceNow Flow Designer flow triggered when a new Incident Workflow record is created and its Category field is empty. Conditional branches evaluate the Short Description against predefined keywords, then update Category and Subcategory.
Key Features	• Implement keyword-based automatic ticket classification. • Configure dependent Subcategory choices based on Category.

	• Send a confirmation email to the caller after ticket submission. • Generate ticket reference numbers automatically. • Verify flow execution and email logs. • Export configuration through an Update Set XML package.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	Cloud platform resources to configure and run workflows	ServiceNow instance and internet-connected computer
Memory / Storage	Storage for ticket records, configuration, and logs	Platform-managed cloud resources
Software		
Platform	IT service management and workflow platform	ServiceNow Now Platform
Automation Tool	Visual workflow builder and record actions	ServiceNow Flow Designer
Notification	Email generation and delivery	Send Email action and ServiceNow email logs
Data		
Incident Data	Caller, short description, description, category, subcategory, state, and assignment fields	Incident Workflow custom table
Classification Rules	Keywords mapped to target categories and subcategories	Network/Wi-Fi; Hardware/Projector; Access/Forgot Password; Performance/Slow computer
Configuration Package	Package customizations for migration	Local Update Set exported as XML

Expected Benefits

- Reduces manual effort spent on initial ticket categorization.
- Improves consistency through predefined rules and dependent choices.
- Provides faster acknowledgement through automated email.
- Supports reporting with standardized incident category data.

Limitations and Future Enhancements

The current approach depends on predefined keywords and may not classify ambiguous descriptions or unfamiliar wording. Future enhancements may include Predictive Intelligence/NLP, automatic assignment group routing, SLA escalation, Virtual Agent integration, and knowledge-base suggestions.
