

Performance Testing

Date	29 September 2026
Team ID	SWTID-2026-1038
Project Name	Auto Ticket Classification Using Flow Designer
Maximum Marks	5 Marks

Performance Testing

Performance testing documents how the automated ticket-classification workflow behaves when tickets are created and processed. Record the test environment, workload, measured results, and observations below. Target values are suggested acceptance goals; enter actual values only after running tests in your ServiceNow instance.

Step 1: Testing Overview

Field	Details
Testing Tool Used	ServiceNow Flow Designer execution details / execution logs; approved monitoring tool if available
Type of Testing	Workflow timing, small-batch load testing, classification validation, and error-path testing
Target Module / API	Incident/ticket creation, classification flow, assignment group, category and priority updates
Test Environment	ServiceNow development or test instance; record instance/build details
Test Date	_____

Step 2: Test Scenarios

S.No	Test Scenario / Description	Tickets	Duration	Expected Outcome
1	Create a ticket with a clear description and known category keywords.	1	Record actual	Flow triggers and assigns the expected category.
2	Create tickets for several issue types such as access, network, hardware and software.	10-ticket batch	Record actual	Tickets are classified and routed according to configured rules.
3	Create multiple tickets in quick succession to observe workflow processing.	10–25	Record actual	All submitted tickets are processed without unexpected failures.
4	Submit a ticket with an empty or unclear description.	1	Record actual	Fallback/default handling occurs; ticket is not silently lost.

Step 3: Performance Test Results

S.No	Metric	Suggested Target	Actual Value	Status	Remarks
1	Average processing time per ticket	Suggested goal: under 5 seconds where measurable			
2	Maximum processing time per ticket	Investigate unusually slow executions			
3	Correct classification rate	At least 95% on a labeled test set, if applicable			
4	Workflow failure rate	0 unexpected failures in the test batch			
5	Correct assignment group / priority	Matches configured rules for each test case			
6	Batch ticket handling	All submitted test tickets are processed			

Step 4: Observations & Analysis**Key Findings**

Record processing times, classification correctness, and whether all flows completed successfully.

Bottlenecks Identified

Record slow flow steps, delays in lookups, repeated updates, or failed actions. If none were observed, state that testing did not identify any.

Optimization Steps Taken

Record changes actually made, such as simplifying conditions, reducing unnecessary updates, or improving fallback handling.

Step 5: Screenshots / Evidence**Evidence 1: Flow execution details / execution log**

Paste or attach screenshot here.

Evidence 2: Sample ticket showing classification and assignment result

Paste or attach screenshot here.

Note: This is a test-report template. Actual performance values, pass/fail status, and evidence must be filled in after testing; no test execution results are assumed.
