

Communication

Date	29 September 2026
Team ID	SWTID-2026-1038
Project Name	Auto Ticket Classification & Routing System using Flow Designer
Maximum Marks	1 Mark

Communication Plan:

Effective communication is essential for a successful project demonstration. This document outlines the communication strategy used within the team and with stakeholders throughout the project lifecycle, including how updates, issues, and feedback were managed.

S.No	Communication Type	Frequency	Channel / Tool	Participants	Purpose
1	Team Standup	Daily	Microsoft Teams / Slack	All 5 Team Members (A Sowndarya, R Nishandhini, A Amirthasri, S Paraneeshwari, R Roshini)	Review progress on Flow Designer classification branches, parse keywords rules, sync daily staging tasks.
2	Progress Update	Weekly	ServiceNow Dashboard & Email	Team Members & Team Leader	Consolidate configuration metrics inside Update Set logs, evaluate table definitions, track schema porting.
3	Issue / Bug Discussion	As Needed	WhatsApp / Ad-hoc Audio Call	Relevant Developers Involved	Debug parent-child sys_dictionary field constraints or clear unclassified description keyword blocks.
4	Stakeholder Review	Bi-Weekly	ServiceNow Sandbox Instance Demo	Entire Team, Project Mentor	Demonstrate automated transaction log logs ('sys_email') parsing verification, validate accuracy metrics.
5	Final Demo Rehearsal	Once	Presentation Sandbox Platform	All 5 Team Members	Run real-time edge testing scenarios (Wi-Fi, Projector, Password triggers) ensuring 100% zero-touch pass rate.
6					

Communication Challenges & Resolutions:

S.No	Challenge Faced	Resolution / Action Taken
------	-----------------	---------------------------

1	Ambiguity in Multi-Issue Descriptions: Description text matching multiple automated triggers (e.g., 'WiFi is slow and projector is broken') caused routing conflicts between infrastructure teams.	Structured an explicit hierarchical execution rule stack inside Flow Designer where high-priority categorization matrices take server-side operational precedence.
2	Dictionary Dependency Integration Gaps: Synchronizing cross-browser field states dynamically across client forms without generating hard schema breaks or missing reference links.	Configured parent-child validation rules natively using standard Advanced System Dictionary mappings, preventing corrupt combinations entirely.
3	Deployment Configuration Tracking: Capturing distributed workflow modifications across isolated team accounts without losing trace logs or version control tags.	Enforced centralized deployment habits where all visual schema builds are committed to a designated shared Update Set container exported as a definitive XML build package.
